Project Assignment 3:

Remaining Use Cases Implementation with Design Pattern Integration & Project Completion

Objective: For this assignment, each group should implement the remaining 3 use cases from their project. The selected use case must demonstrate the design patterns previously mapped to it. Submit your implementation to GitHub and include a task matrix (TASK_MATRIX.md) in your repository that outlines the workload distribution—indicating which team member contributed to which parts of the assignment. Update the software design document describing the implemented software's design.

Deadline: 23 July 2025, 23:59 (No Extension)

Submission Instructions:

- Each team is required to submit their work on GitHub, ensuring clear commit messages and contribution tracking for each member.
- Maintain the traceability via numbering and naming conventions throughout the design, implementation and test for the remaining use cases.

Deliverables:

- Up-to-date Software Design Document (Please see the PA2 for its scope)
- Test Report (in excel: test name & number, test steps, who carried out the test, when, actual and expected results, test environment, logs, status (Pass/Fail/Blocked), notes/explanations)
- Source code of the remaining use cases (the project demo shall be based on the same implementation)

GitHub Submission: You will submit your work for each assignment through GitHub.
